

Seq2Seq in Action: Column Segmentation

Part 1

Bill Watson

S&P Global

January 16, 2020

What are Sequence to Sequence Models?

- ▶ Generally used to convert one set of tokens into another
 - ▶ Many - to - Many RNN
- ▶ Bleak view: map a sequence of indexes to another independent set of indexes

Figure: The pile gets soaked with data and starts to get mushy over time, so it's technically recurrent.

Use Case: Extracting Tables from Images

Primer: What are we trying to accomplish

- ▶ Tabular data is locked in PDFs
 - ▶ Either as a typeset document
 - ▶ Or as a scanned image
- ▶ Sometimes copy & paste won't suffice (or impossible with images)
- ▶ Let's take a quick look at the full pipeline to see where Seq2Seq models can fit in

What is our data?

- ▶ Given a sequence of text, can we predict where to insert columns?

Revisiting Column Segmentation as a Seq2Seq Problem

- ▶ Translation Task
- ▶ Given a sequence of tokens
- ▶ Translate into the same set of tokens, but with a special **<SEG>** token

Less imputed interest (174,862.64)
↓
Less imputed interest <SEG> (174,862.64)

Seq2Seq Architecture

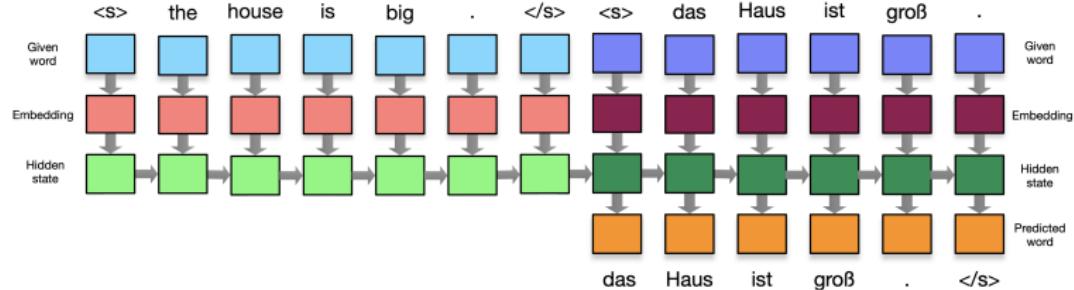

- ▶ We can use a **Encoder-Decoder** style model!

Encoder-Decoder Architecture

Overview: Encoders and Decoders

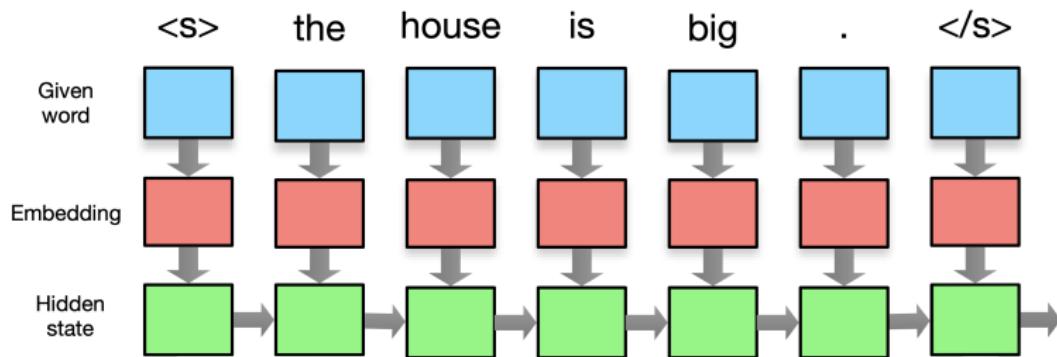

- ▶ We have 2 sub-networks: an **Encoder** and a **Decoder**
- ▶ Encoders
 - ▶ Give the source sentence meaning
- ▶ Decoders
 - ▶ Emit a variable-length sequence
- ▶ We will discuss how to connect the two for joint training

Overview: Encoders and Decoders

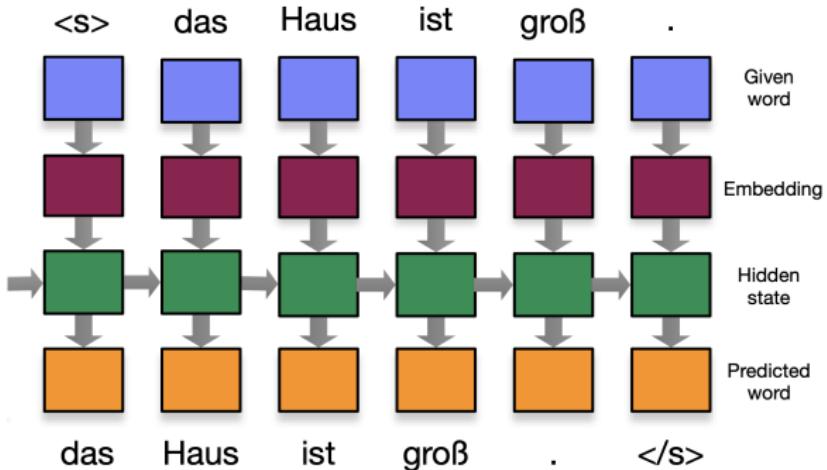

- ▶ Encapsulation allows for flexible design choices
- ▶ **Embeddings**
 - ▶ Pre-trained
 - ▶ DIY
- ▶ **Recurrent Layer**
 - ▶ Type
 - ▶ Depth
 - ▶ Directionality

What makes an Encoder?

- ▶ Recall: **Encoders** give the source sentence meaning
- ▶ Effectively a language model, without a layer to predict the next word
- ▶ Idea is to pass on the hidden state, and possibly use the encodings directly

What makes a Decoder?

- ▶ Recall: **Decoders** provide a new sequence conditioned on the Encoder's hidden state
- ▶ Starts with the Encoder's hidden state, and predicts one token at a time
- ▶ Re-feed the predicted token back into the decoder

Word Embeddings: Practical Considerations

Column Segmentation Issue: Vocabulary Size

- ▶ Is the text actually important?
- ▶ Over 10K **unique tokens**, mostly numbers

Column Segmentation Issue: Vocabulary Size

- ▶ Is the text actually important?
- ▶ Over 10K **unique tokens**, mostly numbers
- ▶ **Solutions:**
 - ▶ Token → Part-of-Speech
 - ▶ Numeric Value → **(NUM)**
- ▶ Reduces vocabulary size to **21 tokens**
- ▶ But lets take a look at alternative solutions to managing vocab size

Recap: Word Embeddings

$$\begin{array}{l} \text{the} \rightarrow \begin{bmatrix} 1.23 & -0.58 & 0.22 & -0.80 & 0.61 \end{bmatrix} \\ \text{cat} \rightarrow \begin{bmatrix} -1.10 & 1.23 & 0.17 & -0.21 & 1.43 \end{bmatrix} \\ \text{is} \rightarrow \begin{bmatrix} -0.26 & 0.70 & 0.27 & 0.59 & -1.04 \end{bmatrix} \\ \text{black} \rightarrow \begin{bmatrix} -1.13 & -0.81 & -0.53 & -0.59 & 0.26 \end{bmatrix} \end{array}$$

- ▶ A trick to map tokens to vector representations

Recap: Pretrained Word Embeddings

- ▶ Co-occurrence Matrix
- ▶ Pointwise Mutual Information
- ▶ SVD Co-occurrence
- ▶ Ngram
- ▶ CBOW, Skip Gram
- ▶ GloVe
- ▶ ELMo
- ▶ BERT

DIY Embeddings

- ▶ We can always train our own!

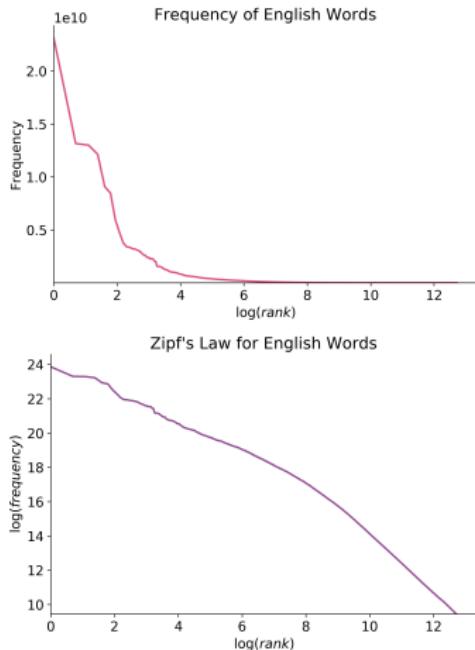

Special Tokens for Sequence Modeling

- ▶ $\langle \text{PAD} \rangle$ → Padding / Masking
- ▶ $\langle \text{UNK} \rangle$ → Unknown words
- ▶ $\langle \text{SOS} \rangle$ → Start of Sentence
- ▶ $\langle \text{EOS} \rangle$ → End of Sentence

```
 $\langle \text{SOS} \rangle$  Data Science is the  $\langle \text{UNK} \rangle$  !  $\langle \text{EOS} \rangle$ 
 $\langle \text{SOS} \rangle$  I  $\langle \text{UNK} \rangle$  for S&P .  $\langle \text{EOS} \rangle$   $\langle \text{PAD} \rangle$ 
 $\langle \text{SOS} \rangle$  Hello World !  $\langle \text{EOS} \rangle$   $\langle \text{PAD} \rangle$   $\langle \text{PAD} \rangle$   $\langle \text{PAD} \rangle$ 
```

Mangaging the Vocab Size

- ▶ Languages are unevenly distributed
- ▶ Many rare words, names → inflates the size of the vocabulary
- ▶ **Problem:**
 - ▶ Large embedding matrices for source, target language
 - ▶ Large output layers for prediction and softmax
- ▶ Naive Solution: Limit the vocab size to most frequent

Morphology, Compounding, and Transliteration

- ▶ Morphological Analysis

tweet, tweets, tweeted, tweeting, retweet, ...

- ▶ Compound Splitting

- ▶ **homework** → **home·work**
- ▶ **website** → **web·site**

- ▶ Names, Places, Proper Nouns

- ▶ **Hoboken, Baltimore, Obama, Michelle**
- ▶ Can do Transliteration

Handling Numbers

- ▶ Do we really need to encode every number? **NO!**

I pay **950.00** in May **2007** > I pay **2007** in May **950.00**

Handling Numbers

- ▶ Do we really need to encode every number? **NO!**

I pay **950.00** in May **2007** > I pay **2007** in May **950.00**

- ▶ **Solution 1:** Replace with a **<NUM>** token, but

I pay **<NUM>** in May **<NUM>** = I pay **<NUM>** in May **<NUM>**

Handling Numbers

- ▶ Do we really need to encode every number? **NO!**

I pay 950.00 in May 2007 > I pay 2007 in May 950.00

- ▶ **Solution 1:** Replace with a $\langle \text{NUM} \rangle$ token, but

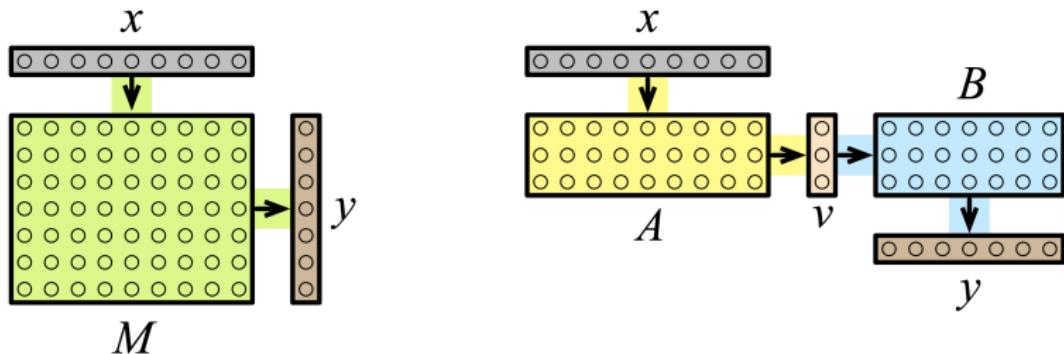

I pay $\langle \text{NUM} \rangle$ in May $\langle \text{NUM} \rangle$ = I pay $\langle \text{NUM} \rangle$ in May $\langle \text{NUM} \rangle$

- ▶ **Solution 2:** Replace each digit with a unique symbol, e.g. 5

I pay 555.55 in May 5555 > I pay 5555 in May 555.55

- ▶ This reduces the need for embeddings, when we can simply do transliteration

Factored Decomposition

- ▶ **Problem:** Large input and output vectors
 - ▶ $|x| = 20,000, |y| = 50,000 \rightarrow |M| = 1,000,000,000$
- ▶ **Solution:** Use a bottleneck with smaller matrices A, B
 - ▶ $|v| = 100 \rightarrow |A| = 2,000,000, |B| = 5,000,000$
 - ▶ Total Parameters: 7,000,000

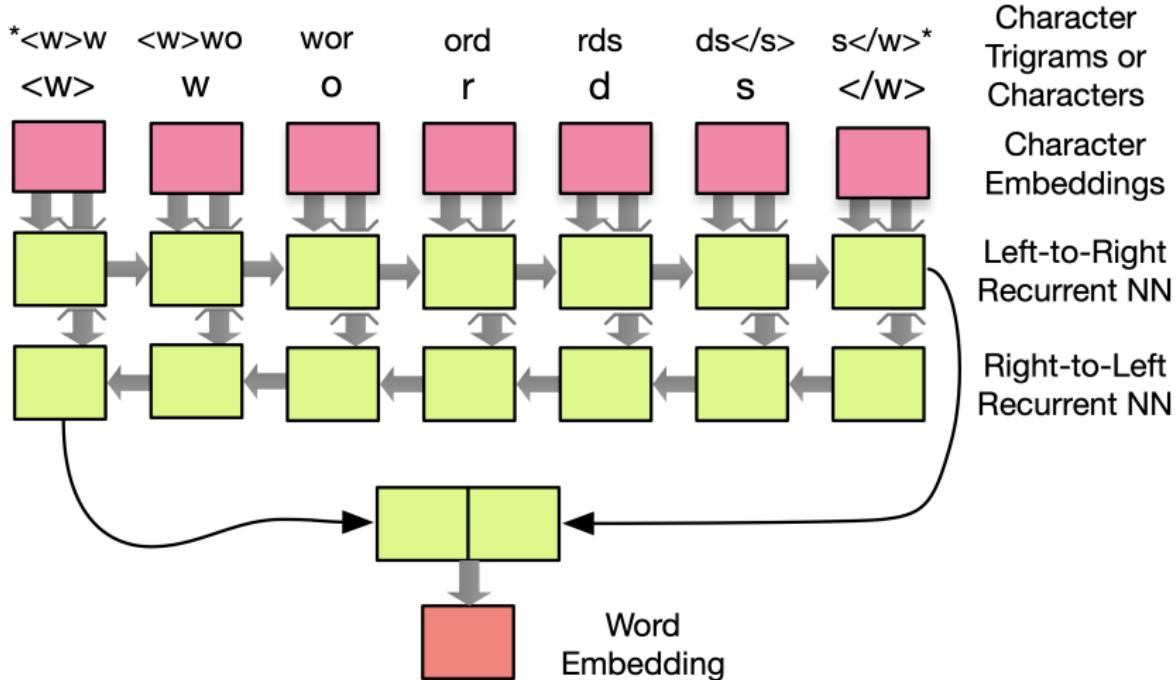

Character-Based Models

- ▶ Instead use embeddings for character string
`b e a u t i f u l`
- ▶ Idea is to induce embeddings for unseen morphological variants:
`beautiful`
- ▶ Tokens are single characters, symbols, whitespace

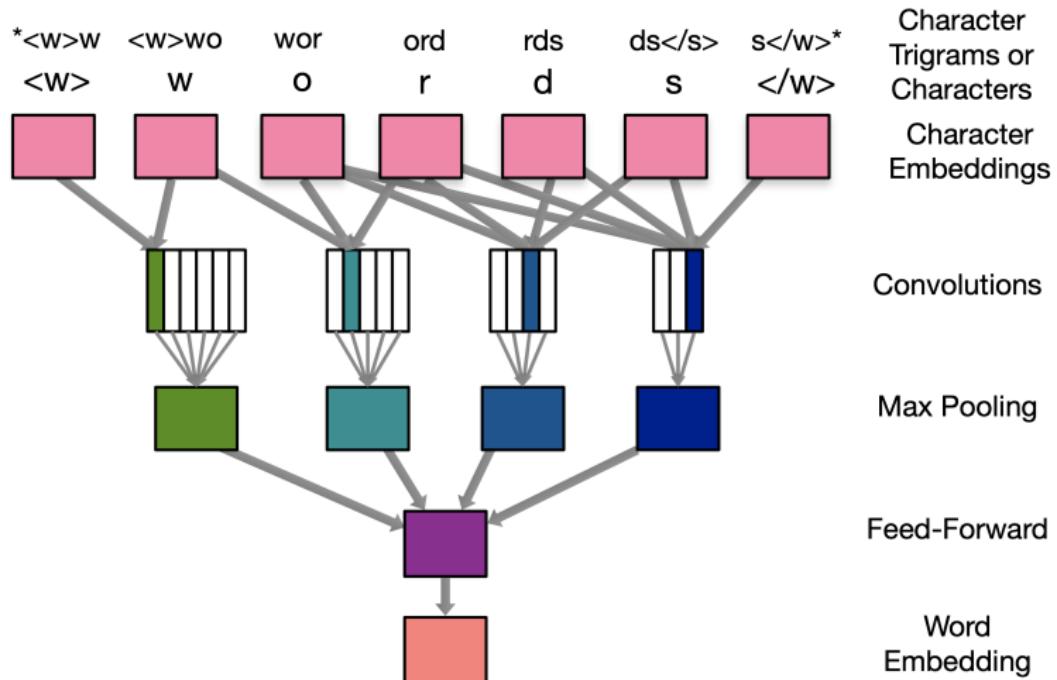

Character-Based Models

- ▶ Instead use embeddings for character string
`b e a u t i f u l`
- ▶ Idea is to induce embeddings for unseen morphological variants:
`beautiful`
- ▶ Tokens are single characters, symbols, whitespace
- ▶ Generally poor performance

Character-Based Models

Character-Based Models

BPE Subwords

```
the · f a t · c a t · i s · i n · t h e · t h i n · b a g  
t h → th     the · f a t · c a t · i s · i n · t h e · t h i n · b a g  
a t → at     the · f at · c at · i s · i n · t h e · t h i n · b a g  
i n → in     the · f at · c at · i s · i n · t h e · t h i n · b a g  
t h e → the   the · f at · c at · i s · i n · t h e · t h i n · b a g
```

- ▶ Breaks words into subwords
 - ▶ Starts with the character set
 - ▶ Merges the most frequent pairs, one per iteration
- ▶ Unsupervised (accidental) morphology (frequency suffixes)

BPE Tokenization on HHGTTG

- ▶ Unique Characters: 101
- ▶ Unique BPE Tokens (1K iterations): 1,093
- ▶ Unique BPE Tokens (5K iterations): 4,817
- ▶ Unique Tokens: 9,541

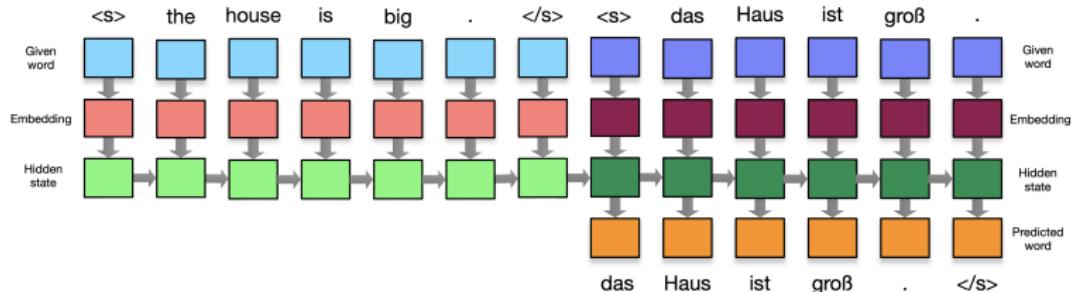

there is a theory which states that if ever anything one day succeeds or even succeeds itself what the universe is for and why it is here , it will instead of always appearing again and being replaced by something even more bizarre and interesting .

there is another theory which states that this has already happened .

in the beginning the universe was created . this has made a lot of people very angry and been widely regarded as a bad move .

Column Segmentation Architecture

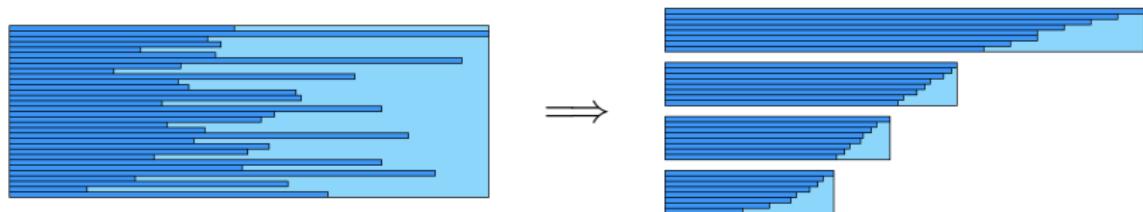

Seq2Seq Architecture

```
Seq2Seq(  
    (encoder): Encoder(  
        (embedding): Embedding(21, 256)  
        (gru): GRU(256, 128, num_layers=2, batch_first=True)  
    )  
    (decoder): Decoder(  
        (embedding): Embedding(22, 256)  
        (gru): GRU(256, 128, num_layers=2, batch_first=True)  
        (fc): Linear(in_features=128, out_features=22, bias=True)  
    )  
)  
The model has 508,438 trainable parameters
```

Training Considerations

Increasing Throughput through Batching

- ▶ We can pad sentences of different lengths to increase batch size
- ▶ While also minimizing the use of padding
- ▶ Matrix Operations are faster
- ▶ **Warning!** Make sure padding is not influencing the hidden state

Teacher Forcing

- ▶ Instead of refeeding the predicted token, replace it with the true token randomly
- ▶ This is only done during training, not inference

$$y_{i+1} = \begin{cases} \operatorname{argmax}_j \theta_i & \mathcal{U}(0, 1) < \text{TF} \\ t_{i+1} & \text{else} \end{cases}$$

- ▶ t_{i+1} is the true token
- ▶ TF is the teacher forcing ratio

Cross Entropy and Label Smoothing

$$\begin{aligned}\ell(\mathbf{x}, y_i) &= -\log \left(\frac{\exp x_{y_i}}{\sum_j \exp x_j} \right) \\ &= -\underbrace{x_{y_i}}_{\max} + \log \underbrace{\sum_j \exp x_j}_{\min}\end{aligned}$$

- ▶ Softmax and Cross-Entropy loss assign all the probability mass to a single word
 - ▶ LogSumExp is minimized on confident predictions
- ▶ Solution: **smooth** the distribution

Cross Entropy and Label Smoothing

- ▶ Softmax

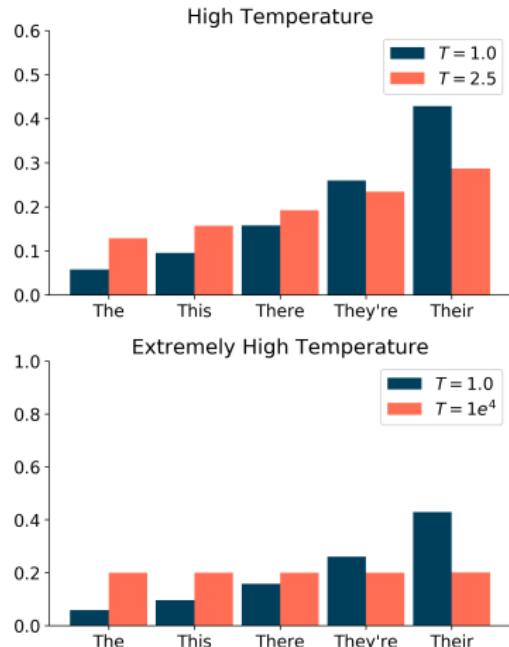

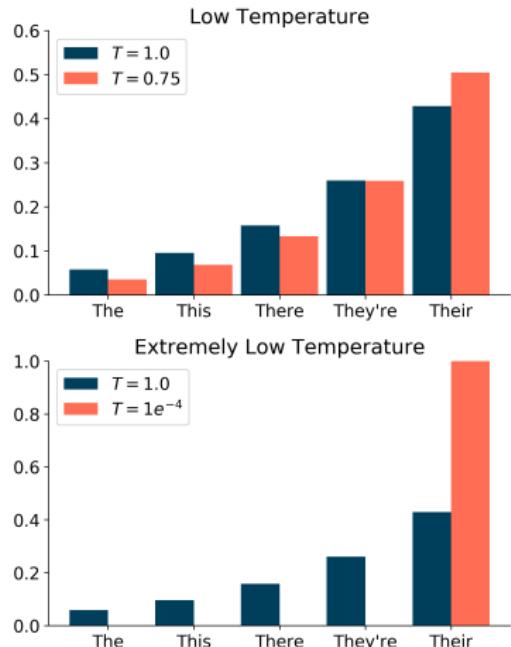

$$p(y_i) = \frac{\exp x_{y_i}}{\sum_j \exp x_j}$$

- ▶ Smoothed Softmax with Temperature T

$$p(y_i) = \frac{\exp (x_{y_i}/T)}{\sum_j \exp (x_j/T)}$$

- ▶ As $T \rightarrow \infty$, the distribution is smoother, uniform
- ▶ AS $T \rightarrow 0$, the distribution approaches a kronecker delta centered on the class with the most mass
- ▶ **Question:** Why do we divide instead of adding/subtracting?

Visualizing Temperature

Monte Carlo Decoding

- ▶ Recall how we select the next token:
 - ▶ **Greedy:** Top token weight
 - ▶ **Teacher Forcing:** Randomly select the true token
- ▶ Note that the outputs are a distribution over the target vocabulary
- ▶ **Use these weights in a multinomial to randomly select a continuation**

$$y_{i+1} \sim \text{Multinomial}(\theta_i)$$

Different Token Decoding Schemes

- ▶ **Greedy:**

$$y_{i+1} = \operatorname{argmax}_j \theta_i$$

- ▶ **Teacher Forcing:**

$$y_{i+1} = \begin{cases} \operatorname{argmax}_j \theta_i & \mathcal{U}(0, 1) < \text{TF} \\ t_{i+1} & \text{else} \end{cases}$$

- ▶ **Monte Carlo:**

$$y_{i+1} \sim \text{Multinomial}(\theta_i)$$

- ▶ θ_i are the output weights from the Decoder
- ▶ t_{i+1} is the true token at position $i + 1$
- ▶ TF is the teacher forcing ratio

Masked Loss

- ▶ Remember, we don't care what gets predicted after seeing a $\langle \text{EOS} \rangle$
- ▶ Hence, we need to mask out the loss for predicted tokens associated with $\langle \text{PAD} \rangle$

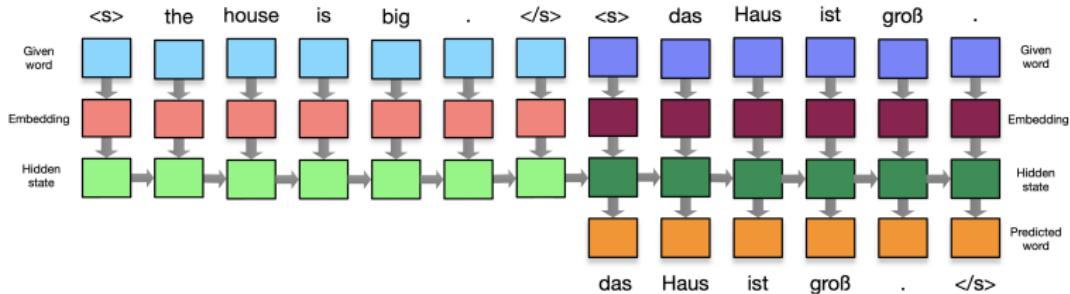

pred	\rightarrow	<i>le</i>	<i>le</i>	<i>chat</i>	<i>chat</i>	<i>chat</i>	<i>chat</i>
		\downarrow	\downarrow	\downarrow	\downarrow	\downarrow	\downarrow
		l	l	l	l	l	0
		\uparrow	\uparrow	\uparrow	\uparrow	\uparrow	\uparrow
true	\rightarrow	<i>le</i>	<i>chat</i>	<i>est</i>	<i>noir</i>	$\langle \text{EOS} \rangle$	$\langle \text{PAD} \rangle$

- ▶ **Solution:** Zero out elements by either:
 - ▶ Multiply pad outputs by 0
 - ▶ Specify the label to ignore in Cross Entropy call

$$\ell(\mathbf{x}, y_i) = \mathbb{1}_{\{y_i \neq \langle \text{PAD} \rangle\}} \cdot \left(-x_{y_i} + \log \sum_j \exp x_j \right)$$

Initial Training Results

Recall: Seq2Seq Architecture

```
Seq2Seq(  
    (encoder): Encoder(  
        (embedding): Embedding(21, 256)  
        (gru): GRU(256, 128, num_layers=2, batch_first=True)  
    )  
    (decoder): Decoder(

Translation Results: TL;DR

- ▶ Reasonably for small sequences
- ▶ Struggles to terminate properly
 - ▶ Maybe more training?
- ▶ Long Sequences are a mess

Translation Results: TL;DR

- ▶ Reasonably for small sequences
- ▶ Struggles to terminate properly
 - ▶ Maybe more training?
- ▶ Long Sequences are a mess
- ▶ **However** this indicates that enough noise can be transferred via the hidden state

Review

- ▶ We have covered:
 - ▶ What are Seq2Seq Models?
 - ▶ How can I reduce my vocabulary size?
 - ▶ How do I train a Seq2Seq model?
- ▶ Part 2 will explore more advanced concepts such as:
 - ▶ Decoding with Beam Search
 - ▶ Modeling Recurrent Relations
 - ▶ Other applications of Sequence Modeling

Thank You!

Seq2Seq in Action: Column Segmentation

Part 2

Bill Watson

S&P Global

January 23, 2020

Review

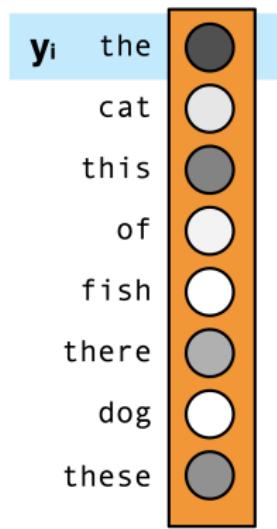

- ▶ We have covered:
 - ▶ What are Seq2Seq Models?
 - ▶ How can I reduce my vocabulary size?
 - ▶ How do I train a Seq2Seq model?
- ▶ Part 2 will explore more advanced concepts such as:
 - ▶ Decoding with Beam Search
 - ▶ Modeling Recurrent Relations
 - ▶ Other applications of Sequence Modeling

Decoding: Making better Translations

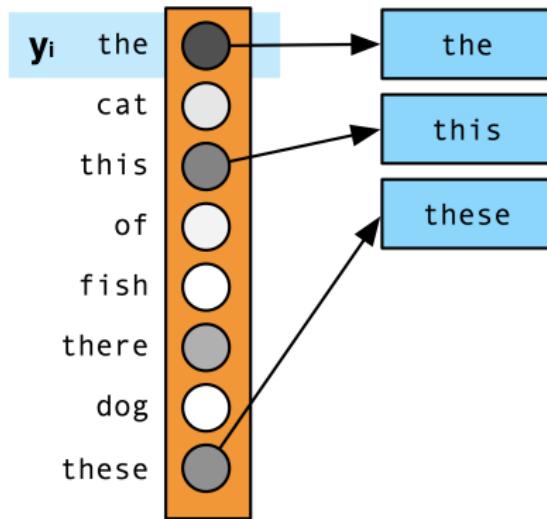

Beam Search

- ▶ Beam Search is a technique to explore different translation paths
- ▶ Based on the idea that you **shouldn't take the greedy path**
- ▶ And that the best path may be sub-optimal during early iterations

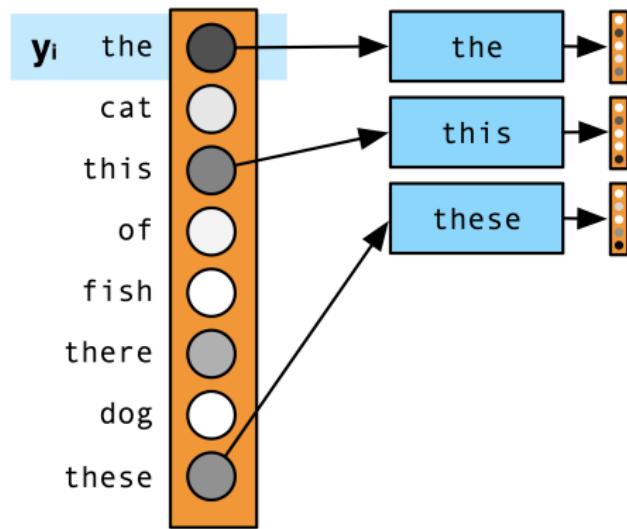

Beam Search

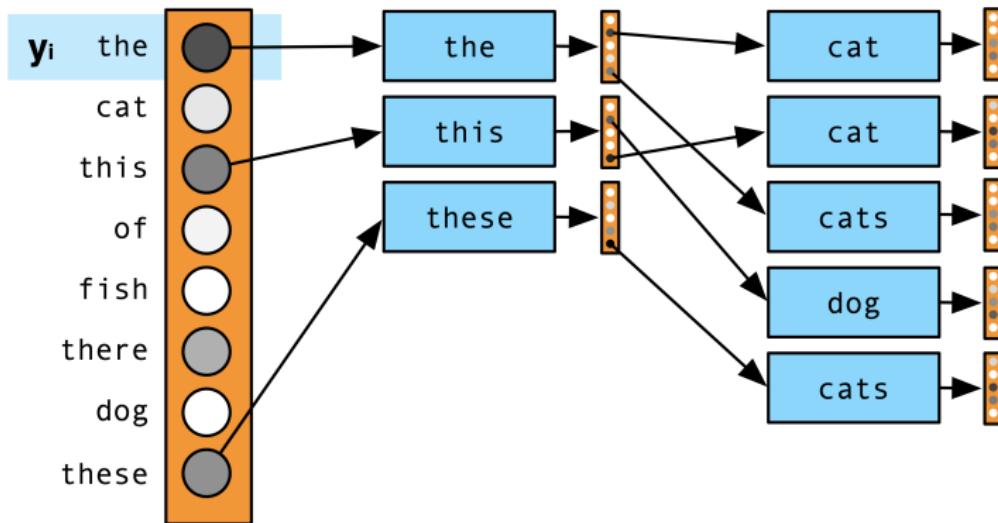

Beam Search

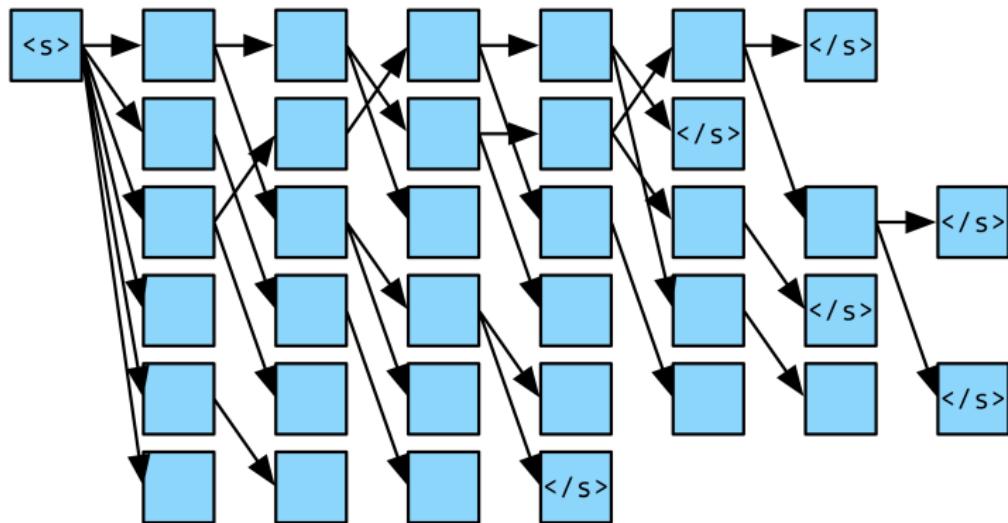

Beam Search

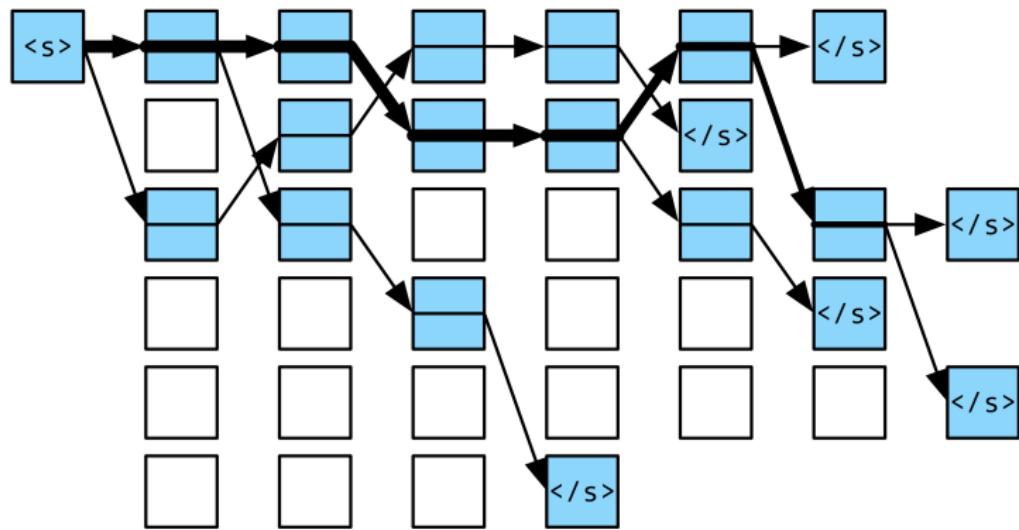

Beam Search

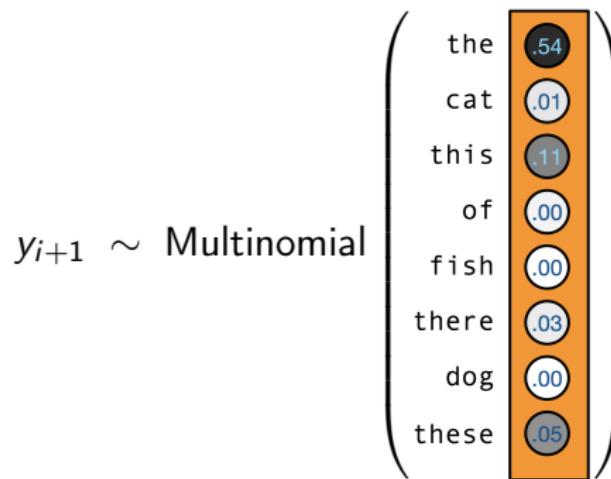

Beam Search

Beam Search

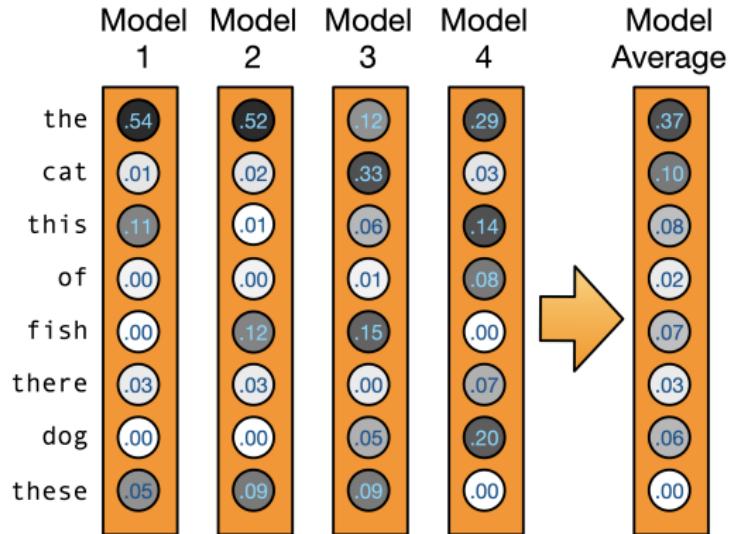

Monte Carlo Beam Search

- ▶ Why not sample n words based on their probabilities?
- ▶ Adds more diversity to beam search results

Ensembling

- ▶ Why not average different models?
- ▶ Random initialization leads to different local solutions
- ▶ Could also use model dumps from different iterations

Modeling Recurrent Relations

Vanilla RNNs

$$h_t = \tanh \left(\underbrace{W_{ih}x_t + b_{ih}}_{\text{input}} + \underbrace{W_{hh}h_{t-1} + b_{hh}}_{\text{hidden}} \right)$$

- ▶ h_t is the hidden state at time t
- ▶ x_t is the input at time t
- ▶ h_{t-1} is the previous hidden state
- ▶ h_0 is initialized to 0

Long Short Term Memory (LSTM)

$$\begin{aligned} \text{Gates} \rightarrow & \left\{ \begin{array}{l} i_t = \sigma(W_{ii}x_t + b_{ii} + W_{hi}h_{t-1} + b_{hi}) \\ f_t = \sigma(W_{if}x_t + b_{if} + W_{hf}h_{t-1} + b_{hf}) \\ o_t = \sigma(W_{io}x_t + b_{io} + W_{ho}h_{t-1} + b_{ho}) \\ g_t = \tanh(W_{ig}x_t + b_{ig} + W_{hg}h_{t-1} + b_{hg}) \end{array} \right. \\ \text{Outputs} \rightarrow & \left\{ \begin{array}{l} c_t = f_t \odot c_{t-1} + i_t \odot g_t \\ h_t = o_t \odot \tanh(c_t) \end{array} \right. \end{aligned}$$

- ▶ h_t is the hidden state at time t
- ▶ c_t is the cell state at time t
- ▶ x_t is the input at time t

Gated Recurrent Units (GRU)

$$\text{Gates} \rightarrow \begin{cases} r_t = \sigma(W_{ir}x_t + b_{ir} + W_{hr}h_{(t-1)} + b_{hr}) \\ z_t = \sigma(W_{iz}x_t + b_{iz} + W_{hz}h_{(t-1)} + b_{hz}) \\ n_t = \tanh(W_{in}x_t + b_{in} + r_t \odot (W_{hn}h_{(t-1)} + b_{hn})) \end{cases}$$

$$\text{Outputs} \rightarrow \begin{cases} h_t = (1 - z_t) \odot n_t + z_t \odot h_{(t-1)} \end{cases}$$

- ▶ h_t is the hidden state at time t
- ▶ x_t is the input at time t

Aside: Different Perspectives on Deep Recurrent Models

- ▶ So far we've only seen Left to Right Sequencing

Aside: Different Perspectives on Deep Recurrent Models

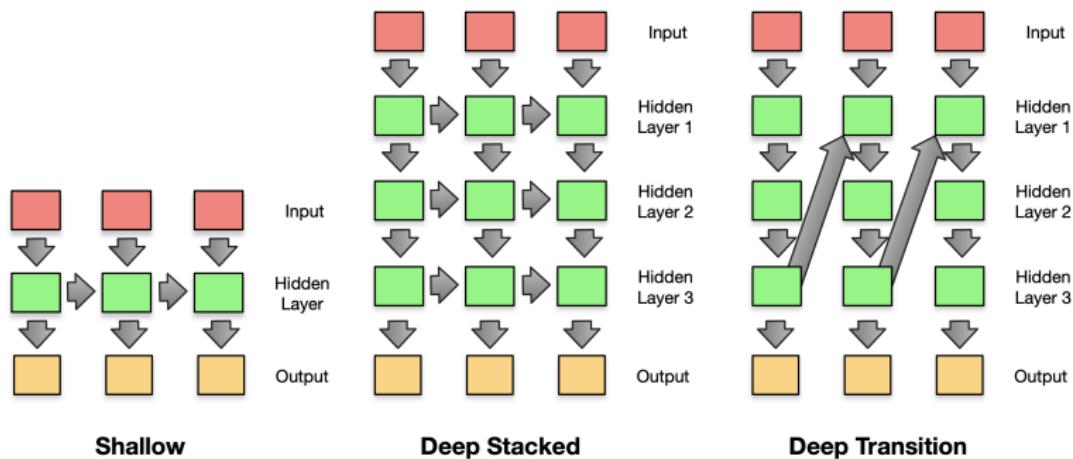

- ▶ So far we've only seen Left to Right Sequencing

- ▶ Why not Right to Left?

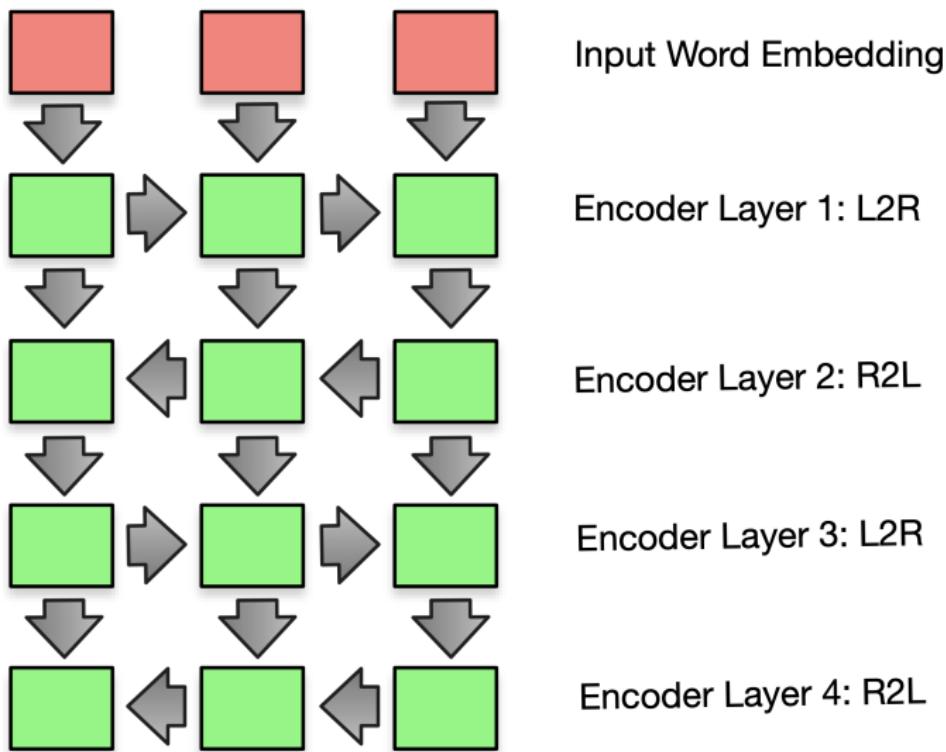

Aside: Different Perspectives on Deep Recurrent Models

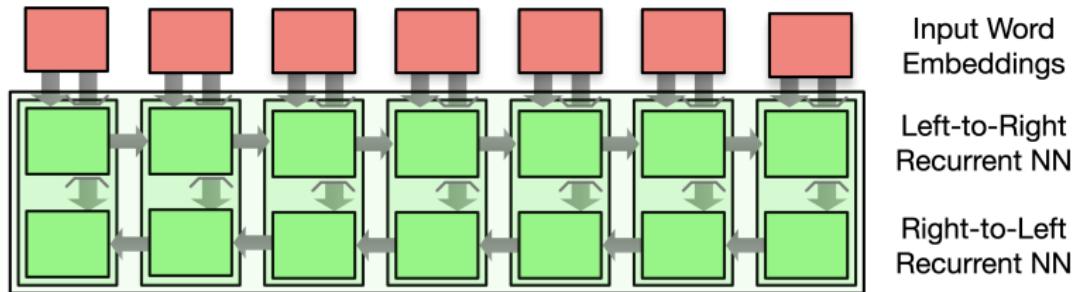

- ▶ Experiment with different stacking techniques

Alternating Recurrent Directions

Bidirectional Sequence Modeling

- ▶ Can capture both left and right context
- ▶ Implementation usually concatenates RNN states

Aside: Dimensionality of Inputs and Outputs (Batch First)

Type	RNN	LSTM	GRU
In	B, L, H_{in}	B, L, H_{in}	B, L, H_{in}
h_{t-1}	$N_L \cdot N_D, B, H_{out}$	$N_L \cdot N_D, B, H_{out}$	$N_L \cdot N_D, B, H_{out}$
c_{t-1}	-	$N_L \cdot N_D, B, H_{out}$	-
h_t	$N_L \cdot N_D, B, H_{out}$	$N_L \cdot N_D, B, H_{out}$	$N_L \cdot N_D, B, H_{out}$
c_t	-	$N_L \cdot N_D, B, H_{out}$	-
Out	$B, L, N_D \cdot H_{out}$	$B, L, N_D \cdot H_{out}$	$B, L, N_D \cdot H_{out}$

- ▶ B is the batch size
- ▶ L is the sequence length
- ▶ N_D is the number of directions
- ▶ N_L is the number of layers
- ▶ H_{in}, H_{out} are the input and hidden size

Aside: The Influence of Padding in RNNs

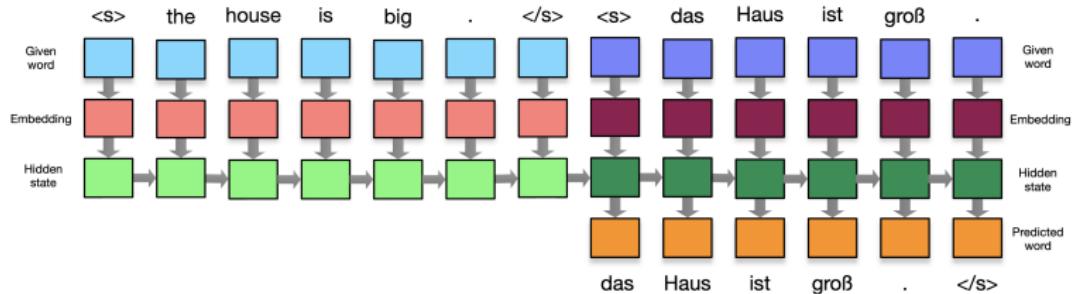

- ▶ Assume the embedding $E[\langle \text{PAD} \rangle] = \mathbf{0}$
- ▶ Are we safe?

Aside: The Influence of Padding in RNNs

- ▶ Assume the embedding $E[\langle \text{PAD} \rangle] = \mathbf{0}$
- ▶ Are we safe? NO!
- ▶ Because of the bias term, zero input does not result in a zero output
 - ▶ This alters the hidden state being passed onto the next iteration
- ▶ Don't even think about the mess bidirectionals become...
- ▶ **Question:** Does this mean we learn the amount of padding for a given sequence?

Applications to Column Segmentation

Applications to Column Segmentation

```
Seq2Seq(  
    (encoder): Encoder(  
        (embedding): Embedding(21, 256)  
        (gru): GRU(256, 128, num_layers=2, batch_first=True)  
    )  
    (decoder): Decoder(  
        (embedding): Embedding(22, 256)  
        (gru): GRU(256, 128, num_layers=2, batch_first=True)  
        (fc): Linear(in_features=128, out_features=22, bias=True)  
    )  
)
```

The model has 508,438 trainable parameters

Column Segmentation: Throw away the decoder

- ▶ Just use an encoder, with an output layer
- ▶ For every token, predict if we should insert a `<SEG>`
- ▶ No longer have to learn the actual sequence

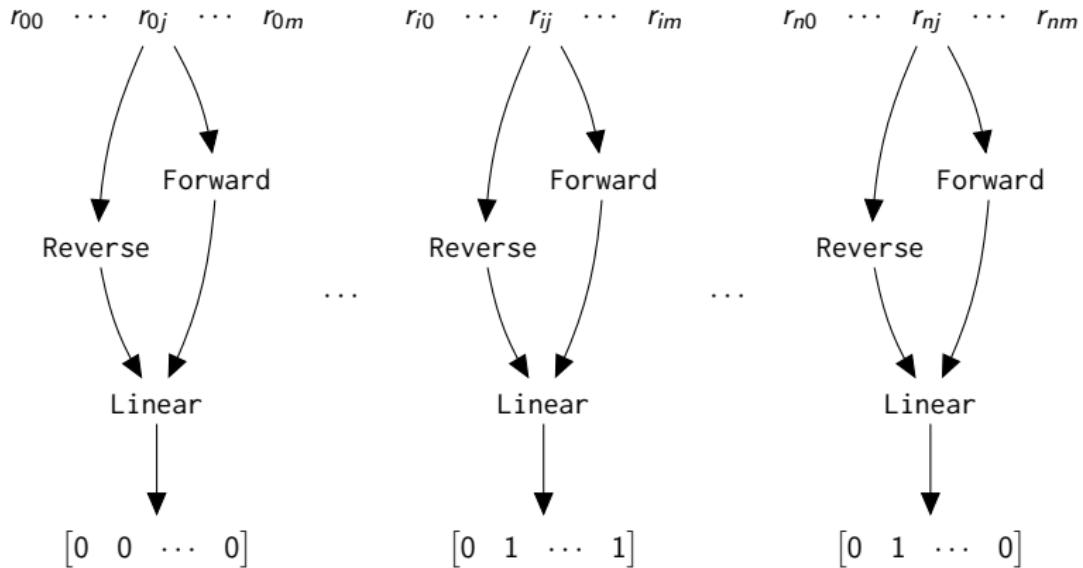

```
Classifier(  
    (encoder): Encoder(  
        (embedding): Embedding(21, 128)  
        (gru): GRU(128, 128, batch_first=True, bidirectional=True)  
    )  
    (linear): Linear(in_features=256, out_features=1, bias=True)  
)  
The model has 201,089 trainable parameters
```

Secondary Approach: Training Labels

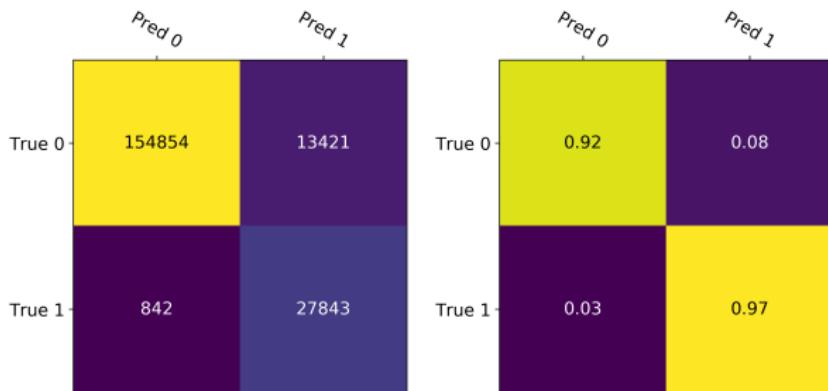

- ▶ Labels are now binary vectors, where $x_i = 1$ implies that there is a $\langle \text{SEG} \rangle$ between x_i and x_{i+1}

Less imputed interest	(174,862.64)		
0	0	1	0	0	0
Less imputed interest	$\langle \text{SEG} \rangle$	(174,862.64)	

Independent Row Training Visual

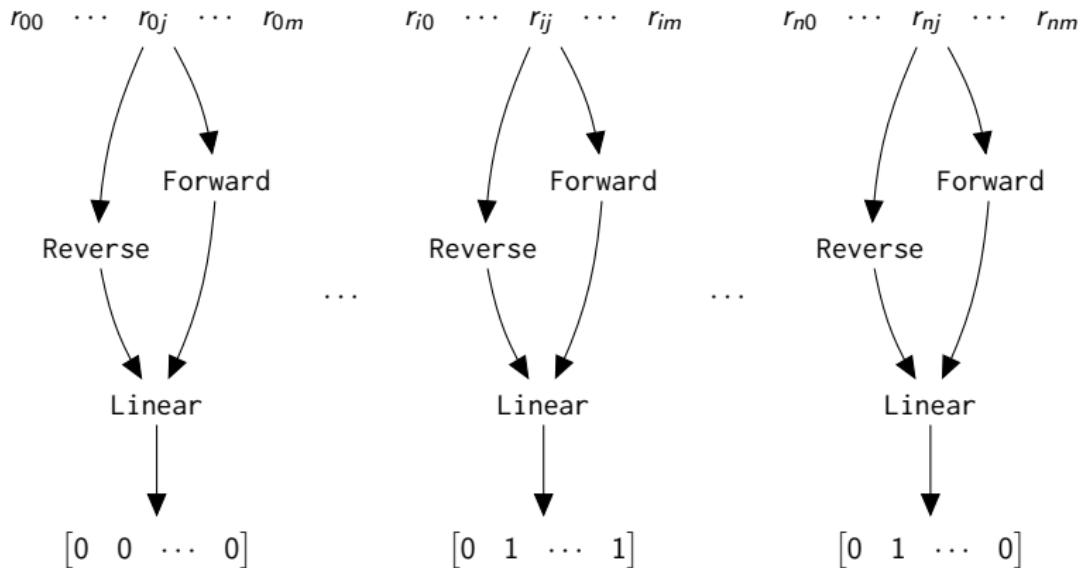

Secondary Approach: Sample Results

	Precision	Recall	F1-Score	Support
Label: 0	0.99	0.92	0.96	168,275
Label: 1	0.67	0.97	0.80	28,685
accuracy			0.93	196,960
macro avg	0.83	0.95	0.88	196,960
weighted avg	0.95	0.93	0.93	196,960

How can we improve on this?

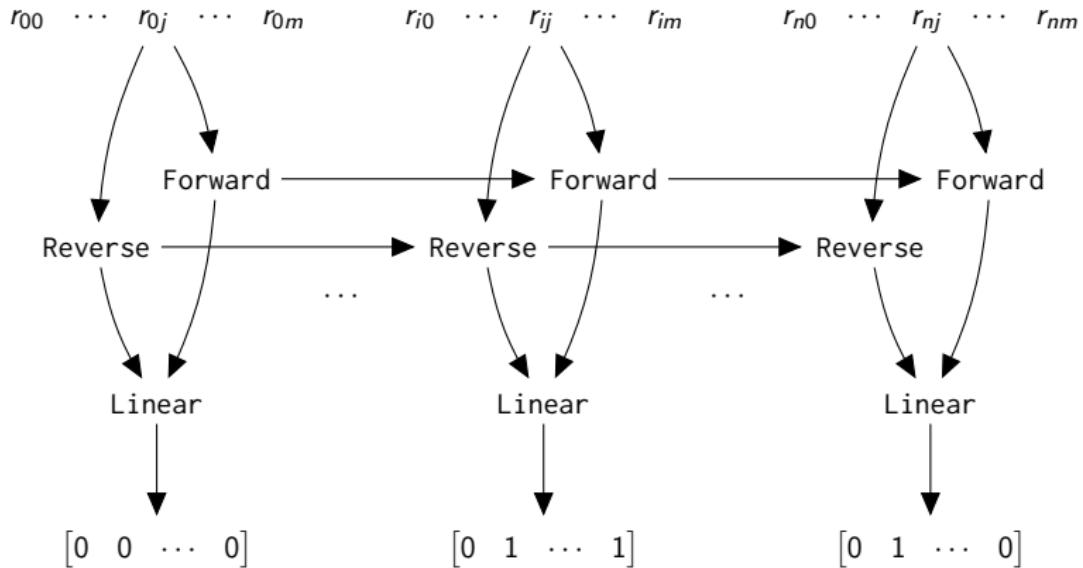

Joint Training on a Table

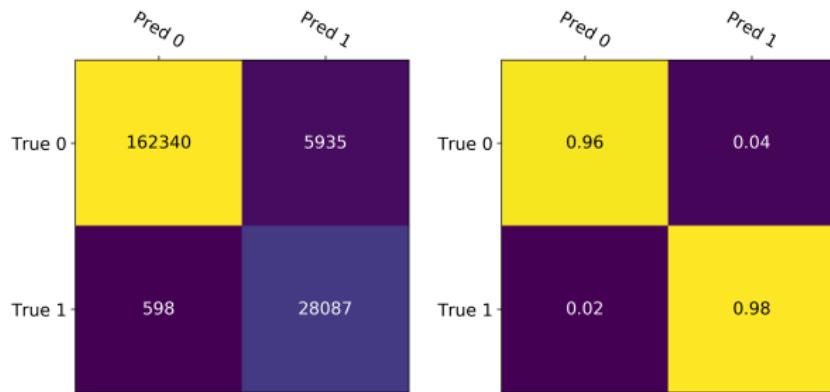

- ▶ We saw that we could regenerate a sequence from its hidden state alone.
- ▶ Why not use this information to link rows within the same table?
 - ▶ Bidirectional for each row
 - ▶ Propagate hidden state to next row
 - ▶ Linear layers for prediction

```
TableClassifier(  
    (embedding): Embedding(21, 128)  
    (rnn): GRU(128, 128, batch_first=True, bidirectional=True)  
    (ff): Linear(in_features=256, out_features=1, bias=True)  
)  
The model has 201,089 trainable parameters
```

Joint Table Training Visual

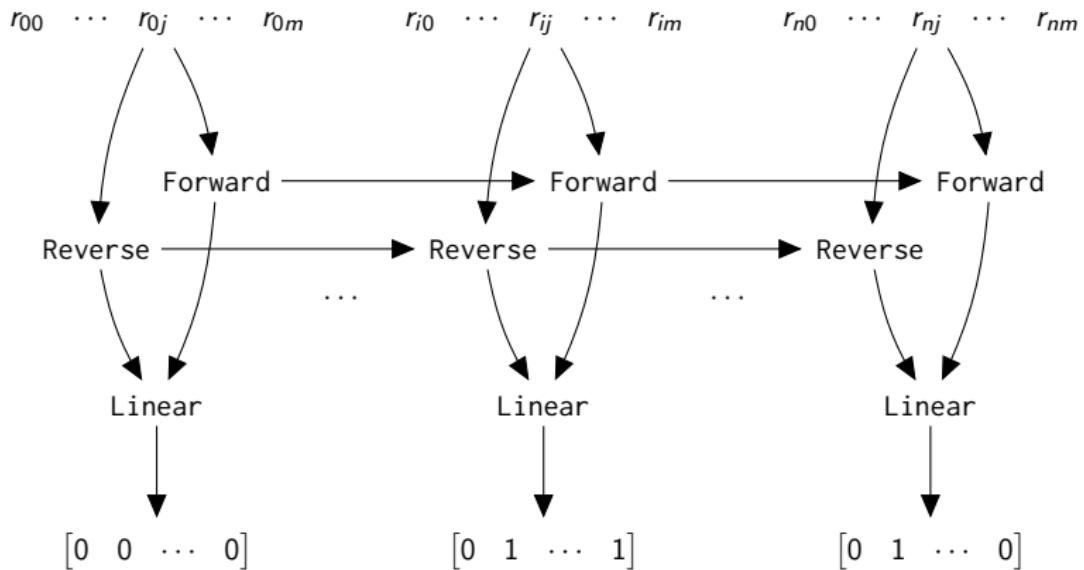

Joint Table Training: Sample Results

	Precision	Recall	F1-Score	Support
Label: 0	1.00	0.96	0.98	168,275
Label: 1	0.83	0.98	0.90	28,685
accuracy			0.97	196,960
macro avg	0.91	0.97	0.94	196,960
weighted avg	0.97	0.97	0.97	196,960

Is this a correct way to link rows?

Joint Table Training with Swapping Visual

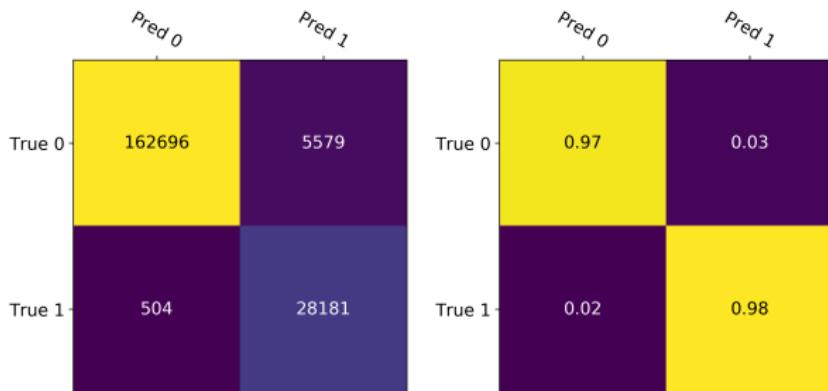

Trick for Swapping in Joint Table Training

- ▶ Note that the hidden state is biased towards the items closest to it
- ▶ So the beginning of a new row has context from the end of the last row
 - ▶ Is this a good choice?
 - ▶ What if we flip the bidirectional hidden states every iteration
 - ▶ AKA the beginning of a new row has the hidden state info from the beginning of the last row
 - ▶ And vice-versa

```
TableClassifierSwap(  
    (embedding): Embedding(21, 128)  
    (rnn): GRU(128, 128, batch_first=True, bidirectional=True)  
    (ff): Linear(in_features=256, out_features=1, bias=True)  
)  
The model has 201,089 trainable parameters
```

Joint Table Training with Swapping: Sample Results

	Precision	Recall	F1-Score	Support
Label: 0	1.00	0.97	0.98	168,275
Label: 1	0.83	0.98	0.90	28,685
accuracy			0.97	196,960
macro avg	0.92	0.97	0.94	196,960
weighted avg	0.97	0.97	0.97	196,960

Summary of Methods

		Independent	Joint	Joint Swapped
Label: 0	Precision	0.99	1.00	1.00
	Recall	0.92	0.96	0.97
	F1-Score	0.96	0.98	0.98
Label: 1	Precision	0.67	0.83	0.83
	Recall	0.97	0.98	0.98
	F1-Score	0.80	0.90	0.90
Accuracy		0.93	0.97	0.97

What have we learned?

- ▶ We can learn text segments purely from the sequence of Part-of-Speech tags
- ▶ It is useful to jointly train/predict on the table instead of assuming independence
- ▶ No significant difference between regular and swapped hidden state propagation
- ▶ Note:
 - ▶ We use the concept of *deep transition* in Seq2Seq for joint training
 - ▶ Where our training is dependent on the hidden state encoding useful information

Future Plans

- ▶ Features
 - ▶ Use word location information
 - ▶ Tesseract gives bounding boxes
- ▶ Encoder Structure
 - ▶ Convolution
 - ▶ Transformer

Other Applications For Sequence Modeling

Recall: Encoders, Decoders, and Seq2Seq Models

- ▶ **Encoders** given a sequence meaning
- ▶ **Decoders** generate a new sequence
- ▶ **Seq2Seq** generate sequences conditioned on another sequence

What to use for which application?

- ▶ **Encoders**
 - ▶ POS Tagging
 - ▶ Sentence Embeddings
 - ▶ Anything where you are given the sentence at test time
- ▶ **Decoders**
 - ▶ Text Generation
 - ▶ Language Modeling
 - ▶ Anything where you need to create a sequence at test time
- ▶ **Seq2Seq**
 - ▶ Translation
 - ▶ Speech Recognition
 - ▶ Summarization
 - ▶ Question/Answering
 - ▶ Anything where you convert a sequence into another sequence
